

Mangrove Restoration Field Audit Report

Project: Mangrove Restoration - Bekasi Coastal Area

Project ID: project_001

Location: Bekasi Coastal Area, Indonesia

Audit period: 1 May 2026 - 1 June 2026

Executive Summary

This synthetic report records a field review of a mangrove restoration project. The project owner claims that 10,000 mangrove seedlings were planted across 24.5 hectares. The field sample and monitoring records support substantial planting activity, but the available documents do not constitute an accredited carbon-credit verification.

Observed Metrics

Metric	Reported value	Audit note
Seedlings planted	10,000	Supported by project register and sensor CSV
Mapped area	24.5 hectares	Consistent with submitted GPS boundary summary
Survival rate	90%	Latest June monitoring figure
Field sample count	1,250 seedlings	Sampled across 5 plots
Independent certification	Not provided	Accredited verifier document missing

Key Findings

1. The project claim of 10,000 planted seedlings matches the June sensor record. 2. The submitted location coordinates are consistent across the GPS metadata and monitoring table. 3. A survival-rate report is available, but the review lacks an accredited third-party carbon auditor signature. 4. No evidence of official issuance or retirement of carbon credits was provided.

Recommendation

Request an accredited verifier statement, methodology reference, baseline calculation, and long-term permanence plan before any carbon credit is issued.
